

Mastering the Query Features of Power BI Desktop

Agenda

- Deciding What To Measure
- Managing Queries, Datasources and Credentials
- Working with the Query Editor Window
- Designing Queries to Generate a Star Schema
- Merging Columns from Multiple Datasources
- Appending Rows from Multiple Datasources

Data Discovery

- Data can live in a variety of sources
 - Files (e.g. CSV file, Excel workbook)
 - OLTP Databases
 - OLAP Databases
 - SharePoint Lists and Document Libraries
 - Azure-based services
 - Online services & SaaS applications

Deciding What To Measure

- You Must Determine Measurable Objectives
 - Financial (revenue, expenses, profit margin, etc.)
 - Business processes efficiency
 - Customer Satisfaction Levels

Defining Grain Statements

- Grain statements should be defined in initial design phase
 - Grain statements helps determine requirements for BI queries
 - Grain statements can be created & understood by business users
- Example grain statements for BI project at Wingtip Toys
 - What was the total sales revenue over the last 4 years?
 - What was the sales revenue by year, quarter and month?
 - What was the sales revenue by region, state, city and zip code?
 - What was the sales revenue by category, subcategory and product?
 - What was the growth in sales revenue from month to month in 2013?
 - What was profit margin for each product by year, quarter and month?
 - Have their been any products with significantly decreasing profit margin?

Sample OLTP Database: WingtipSalesDB

- Online Transaction Processing (OLTP) System
 - Used for real-time data access and transaction-based data entry
 - Optimized for faster transactions (e.g. inserts, updates & deletes)
 - Tables normalized to reduce/eliminate redundancies
 - Table schemas can be hard for business users to understand

Power BI Desktop is an ETL Tool

- ETL process is essential part of any BI Project
 - **Extract** the data from wherever it lives
 - **Transform** the shape of the data for better analysis
 - **Load** the data into dataset for analysis and reporting

Agenda

- ✓ Deciding What To Measure
- Managing Queries, Datasources and Credentials
 - Working with the Query Editor Window
 - Designing Queries to Generate a Star Schema
 - Merging Columns from Multiple Datasources
 - Appending Rows from Multiple Datasources

File-based Data Sources

- Power BI Desktop supports common file types

Working with Web Data Sources

- Many public websites publish data using HTML tables
 - Power BI desktop can scrape data from tables in HTML pages

#	NAME	POS.	HT.	WT.	AGE	EXP.	COLLEGE

DEMO

Scraping Data from a Web Page

Online Service Data Sources

- Power BI Desktop Supports Online Services
 - Includes popular Software-as-a-Service (SaaS) applications
 - Microsoft is working with 3rd vendors to expand this list

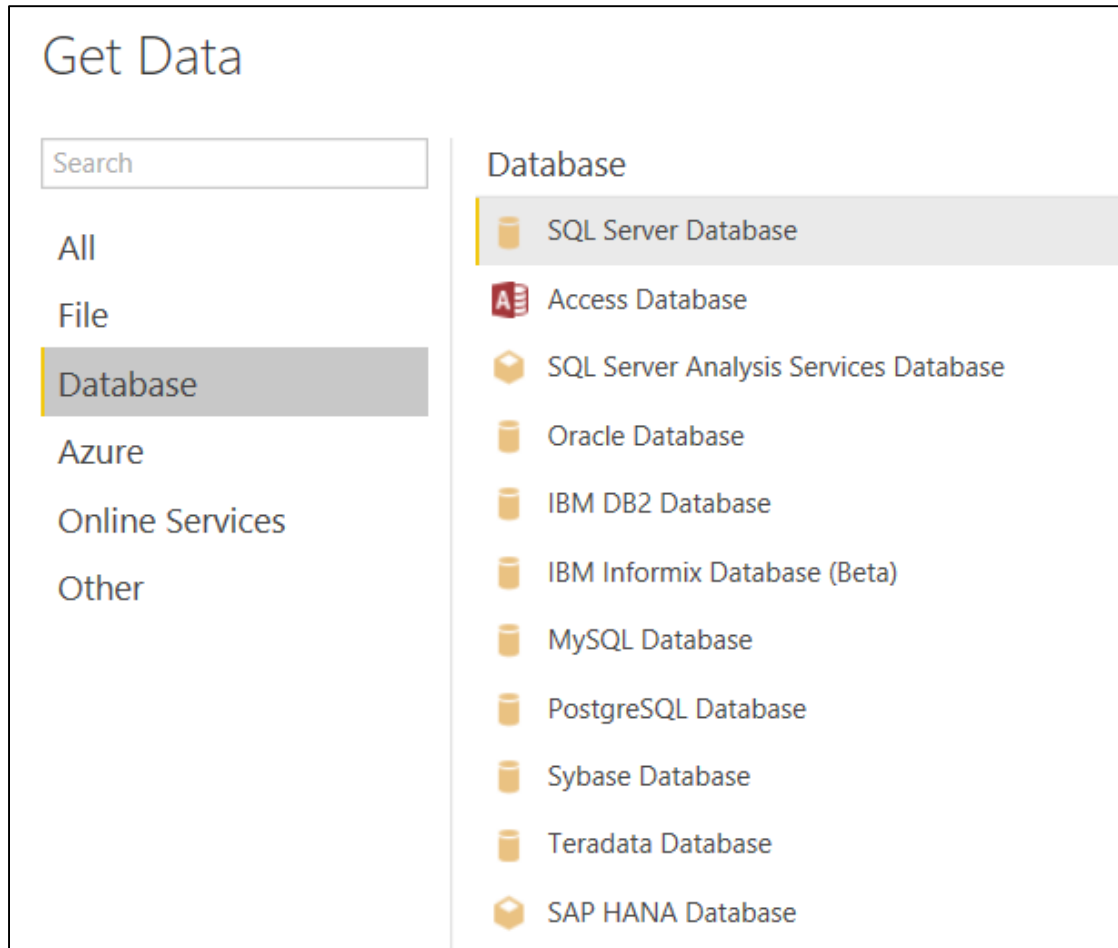

DEMO

Importing Data from a List in SharePoint Online

Supported Databases

- Power BI Desktop supports many database systems

Azure Data Sources

- Power BI Desktop supports many Azure data sources

Selecting Tables from a SQL Database

- Power BI Desktop provides Navigator dialog
 - Allows you to select tables
 - Navigator understands existing table relationships
 - Clicking **Load** will run query and import data
 - Clicking **Edit** will open queries in Query Editor window

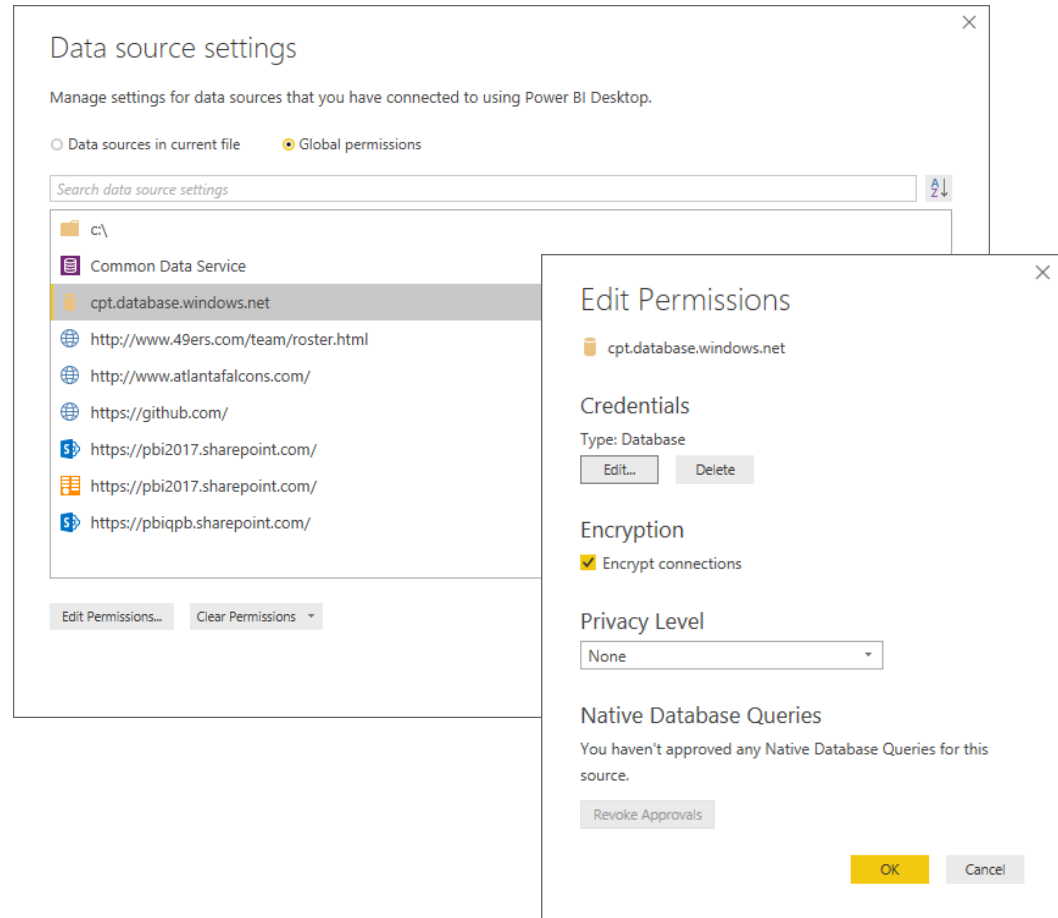

The background of the slide is a close-up, low-angle shot of a server rack. The rack is filled with numerous server units, each featuring a grid of small, glowing blue lights. The perspective is looking up the length of the rack, creating a sense of depth and scale. The overall color palette is dominated by deep blues and bright, cool-toned light blues.

DEMO

Creating Queries to Import Data from an Azure SQL Database

Managing Datasources and Credentials

Agenda

- ✓ Deciding What To Measure
- ✓ Managing Queries, Datasources and Credentials
- Working with the Query Editor Window
 - Designing Queries to Generate a Star Schema
 - Merging Columns from Multiple Datasources
 - Appending Rows from Multiple Datasources

Query Steps

- A query is created as a sequence of steps
 - Each step is a parameterized operation on the data
 - Each step has formula which can be viewed/edited in formula bar
 - Query starts with Source step to extract data from a data source
 - Additional steps added to perform transform operations on data
 - You can replay query operations one by one by clicking on steps

The screenshot displays the Power BI Query Editor interface. The top ribbon includes tabs for File, Home, Transform, Add Column, and View. The Formula Bar at the top shows the formula for the selected step: `= Table.ReplaceValue(#'Replaced Female Values', 'M', 'Male', Replacer.ReplaceText, ...)`. The main area shows a table with 14 rows of customer data. The right sidebar contains the 'Query Settings' pane, which includes the 'APPLIED STEPS' list. The steps are: Source, Navigation, Removed Other Columns, Merged Columns, Reordered Columns, Replaced Female Values, Replaced Male Values (selected), Changed Type, and Added Conditional Column. A red dashed box highlights the 'APPLIED STEPS' list, and a red arrow points from a text box to it.

Customerid	Customer	State	City	Zipcode	Gender
1	Nina Diaz	CA	Eureka	95501	Female
2	Melinda Carter	CA	Napa	94558	Female
3	Pam Miller	CA	Napa	94558	Female
4	Merle Blackwell	CA	Sacramento	95823	Female
5	Ariel Hale	CA	Sacramento	95818	Male
6	Randy Carter	CA	Sacramento	95818	Male
7	Lillie Hinton	CA	Eureka	95501	Female
8	Ladonna Moody	CA	Napa	94559	Female
9	Buddy McKay	OR	Bend	97701	Male
10	Warren Sykes	CA	Sacramento	95818	Male
11	Jan Rutledge	OR	Portland	97216	Female
12	Dallas Lester	OR	Eugene	97402	Male
13	Matthew Zimmerman	OR	Portland	97220	Male

Examples of Basic Power BI Desktop Steps

- Rename column
- Convert column type
- Format column values
- Reorder columns
- Replace column values
- Expanding related column
- Merging columns
- Splitting columns

Replacing Values

- Used to substitute values during import

Replace Values

Replace one value with another in the selected columns.

Value To Find
M

Replace With
Male

Converting Column Types

- Transform data to make it more reliable
 - Convert date-time column to date column
- Transform data to make it more efficient
 - Convert decimal to fixed decimal number for currency

 PurchaseDate	 1 ² ₃ Quantity	 \$ SalesAmount	 \$ ProductCost
1/28/2012	1	2.95	1.2
1/28/2012	6		\$
1/28/2012	1	19.95	1 ² ₃
1/28/2012	5	249.75	
1/28/2012	1	2.95	

Decimal Number
Fixed Decimal Number
Whole Number
Date/Time
Date

- Beware: Conversion can have destructive effect on data

Expanding Related Columns

- Used to pull data from related tables
 - Saves you from performing SQL joins or VLOOKUP

SalesAmount	Invoices	
119.8	Value	Value
29.95	Value	Value
59.9	Value	Value
399.6	Value	Value
29.9	Value	Value
59.8	Value	Value

Id	Invoiceld	ProductId	Quantity	SalesAmount	Invoices	Products
1	1	1				Value
2	2	1				Value
3	3	2				Value
4	4	3				Value
5	5	3				Value
6	6	3				Value
7	7	4				Value
8	8	5				Value
9	9	6				Value
10	10	6				Value
11	11	7				Value
12	12	7				Value
13	13	8				Value
14	14	9				Value

Id	Invoiceld	ProductId	Quantity	SalesAmount	InvoiceDate	CustomerId	Products
1	1	1	22	4	119.8	1/28/2012 12:00:00 AM	1 Value
2	2	1	22	1	29.95	1/28/2012 12:00:00 AM	1 Value
3	3	2	22	2	59.9	1/28/2012 12:00:00 AM	2 Value
4	4	3	17	8	399.6	1/28/2012 12:00:00 AM	3 Value
5	5	3	18	2	29.9	1/28/2012 12:00:00 AM	3 Value
6	6	3	18	4	59.8	1/28/2012 12:00:00 AM	3 Value
7	7	4	16	1	2.95	1/28/2012 12:00:00 AM	4 Value

Merging Columns

- Merge two columns into a single column

Adding a Custom Column

- Custom column provide custom logic
 - Logic must be written in M programming language

Add Custom Column

New column name:

Custom column formula:

```
= if [FirstPurchaseDate]=[LastPurchaseDate]  
then "One-time Customer"  
else "Repeat Customer"
```

Available columns:
CustomerId
Customer
State
City
ZipCode
Gender
BirthDate
FirstPurchaseDate
LastPurchaseDate
CustomerType

<< Insert

FirstPurchaseDate	LastPurchaseDate	CustomerType
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/29/2012	11/22/2015	Repeat Customer
1/29/2012	10/2/2015	Repeat Customer
1/29/2012	1/29/2012	One-time Customer
1/29/2012	5/6/2015	Repeat Customer
1/29/2012	1/29/2012	One-time Customer

Adding a Conditional Column

- Abstracts away need to write M code

Add Conditional Column

Add a conditional column that is computed from the other columns or values.

New column name

	Column Name	Operator	Value		Output
If	<input type="text" value="FirstPurchaseDate"/>	<input type="text" value="equals"/>	<input type="text" value="LastPurchaseDate"/>	Then	<input type="text" value="One-time Customer"/>

+ Add Rule

Otherwise

<input type="text" value="Repeat Customer"/>
--

Advanced Editor

- Power BI Desktop based on "M" functional language
 - Query in Power BI Desktop saved as set of M statements in code
 - Query Editor generates code in M behind the scenes
 - Advanced users can view & modify query code in Advanced Editor

Agenda

- ✓ Deciding What To Measure
- ✓ Managing Queries, Datasources and Credentials
- ✓ Working with the Query Editor Window
- Designing Queries to Generate a Star Schema
 - Merging Columns from Multiple Datasources
 - Appending Rows from Multiple Datasources

Data Modeling using a Star Schema

- OLAP Modeling often based on Star Schema
 - Tables defined as fact tables or dimension tables
 - Fact tables related to dimension table using 1-to-many relationships

Designing Queries to Build a Star Schema

- Converts OLTP Data Model to OLAP Data Model
 - Sales table is modeled as a OLAP Fact Table
 - Other tables are modeled as OLAP Dimension tables
 - Requires pulling CustomerId column into Sales table
 - All dimension tables should be directly related to fact table

DEMO

Using Power BI Desktop to Import Data into a Star Schema

Agenda

- ✓ Deciding What To Measure
- ✓ Working with the Query Editor Window
- ✓ Managing Queries, Datasources and Credentials
- ✓ Designing Queries to Generate a Star Schema
- Merging Columns from Multiple Datasources
 - Appending Rows from Multiple Datasources

Understanding Query Input and Output

- PBIX project is container for data sources and queries
 - Queries created and saved within scope of Power BI project
 - Queries can pull data from local files
 - Queries can pull data from external content sources
 - Queries main purpose is to load imported data into data model

Query Composition

- Query can serve as source for other queries
 - Allows for creation of reusable base queries & query composition
 - Complexity can be hidden in base queries
 - **Reference** command creates new query based on another query

Combining Queries

- Query can be merged or appended with another query
 - Merge operation allows you combine columns from two tables
 - Append operation allows you to combine rows from two tables
- Two queries are combined into single output for loading
 - Load settings of main query determines where output is loaded
 - Secondary query acts as source for main query
 - Secondary query can be created with connection-only load setting

Merging Columns
