Designing a Data Model with Power BI Desktop

Agenda

- Designing a Data model
- Creating Calculated Columns
- Creating Measures
- Adding Geographic Fields to a Data Model
- Creating Dimensional Hierarchies
- Understanding the Evaluation Context

Data Modeling with Power BI Desktop

- Steps to create a data model with Power Pivot
 - Create relationships between tables
 - Modify columns (rename, set formatting, convert type)
 - Create calculated columns
 - Create measures
 - Configure column data categories
 - Create dimensional hierarchies
 - Add Calendar table(s)

Formatting Columns

- Each column has its own formatting properties
 - Formatting propagated to reports and visuals
 - Makes it easier on data model consumers

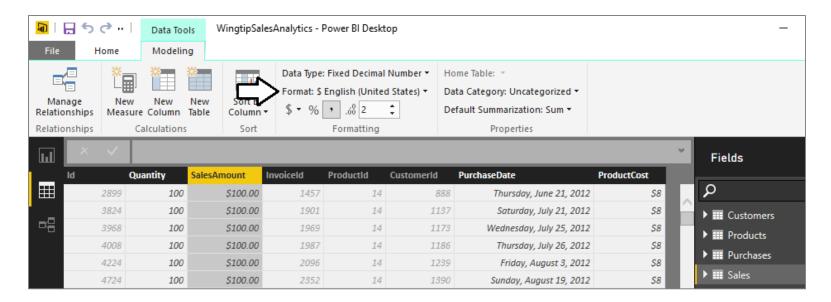

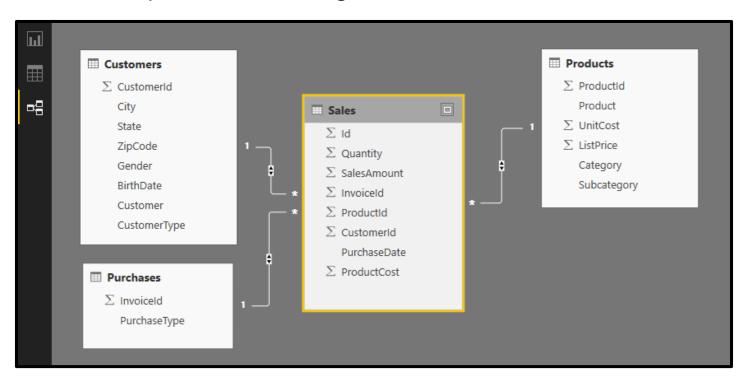

Table Relationships

- Tables in data model associated with relationships
 - Relationships based on single columns
 - Tabular model supports [1-to-1] and [1-to-many] relationships
 - Relationships based on single column in each table

Working with DAX

- DAX is the language used to create data model
 - DAX stands for "Data Analysis Expression Language"
- DAX expressions are similar to Excel formulas
 - They always start with an equal sign (=)
 - DAX provides many built-in functions similar to Excel
- DAX Expressions are unlike Excel formulas...
 - DAX expressions cannot reference cells (e.g. A1 or C4)
 - Instead DAX expressions reference columns and tables

```
=SUM('Sales'[SalesAmount])
```

Writing DAX Expressions

Some DAX expressions are simple

```
Sales Revenue = Sum(Sales[SalesAmount])
```

Some DAX expressions are far more complex

```
Sales Growth PM = IF(
  ( ISFILTERED(Calendar[Month]) && ISFILTERED(Calendar[Date]) = FALSE() ),
  DIVIDE(
   SUM(Sales[SalesAmount]) -
   CALCULATE(
      SUM(Sales[SalesAmount]),
      PREVIOUSMONTH(Calendar[Date])
    ),
   CALCULATE(
      SUM(Sales[SalesAmount]),
      PREVIOUSMONTH(Calendar[Date])
  BLANK()
```

Types of DAX Functions

- Date and Time Functions
- Information Functions
- Logical Functions
- Mathematical and Trigonometric Functions
- Statistical Functions
- Filter Functions
- Text Functions
- Time Intelligence Functions

Agenda

- Designing a Data model
- Creating Calculated Columns
- Creating Measures
- Adding Geographic Fields to a Data Model
- Creating Dimensional Hierarchies
- Understanding the Evaluation Context

Calculated Columns vs Measures

- Calculated Columns (aka Columns)
 - Evaluated based on context of a single row
 - Evaluated when data is loaded into memory

```
Column1 = <DAX expression>
```

- Measures
 - Evaluated at query time based on current filter context
 - Commonly used for aggregations (e.g. SUM, AVG, etc.)
 - Used more frequently than calculated columns

```
Measure1 = <DAX expression>
```

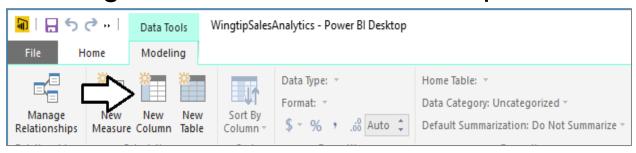

When to Create Calculated Columns

- Measures often better choice than calculate columns
 - Don't create calculated column when you need a measure
 - Prefer to create calculated columns only in specific scenarios
- When should you create calculated columns?
 - To create headers for row labels or column labels.
 - To place calculated results in a slicer for filtering
 - Define an expression strictly bound to current row
 - Categories text or numbers (e.g. customer age groups)

Creating Calculated Columns

- Edited in formula bar of Power Pivot data view
 - Start with name and then equals (=) sign
 - Enter a valid DAX expression
 - Clicking on column adds it into expression

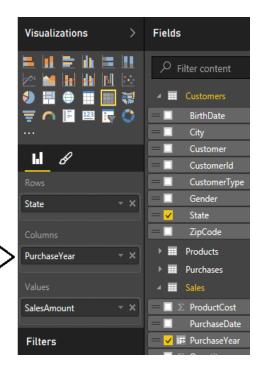

× •	<pre>PurchaseYear = YEAR(Sales[PurchaseDate])</pre>											
ld	Quantity	SalesAmount	Invoiceld	ProductId	CustomerId	PurchaseDate	ProductCost	SalesProfit	PurchaseYear			
2899	100	\$100.00	1457	14	888	6/21/12	\$8.00	\$92.00	2012			
3824	100	\$100.00	1901	14	1137	7/21/12	\$8.00	\$92.00	2012			
3968	100	\$100.00	1969	14	1173	7/25/12	\$8.00	\$92.00	2012			
4008	100	\$100.00	1987	14	1186	7/26/12	\$8.00	\$92.00	2012			
4224	100	\$100.00	2096	14	1239	8/3/12	\$8.00	\$92.00	2012			
4724	100	\$100.00	2352	14	1390	8/19/12	\$8.00	\$92.00	2012			

Calculated Column as a Column Label

- Calculate column can serve as...
 - Row labels
 - Column labels

_			=			
State	2012	2013	2014	2015	Total	
CA	\$270,926.32	\$550,160.02	\$737,878.53	\$770,402.11	\$2,329,366.98	
TX	\$212,085.08	\$490,643.98	\$683,079.11	\$919,030.36	\$2,304,838.53	
FL	\$51,730.85	\$300,866.87	\$535,693.94	\$891,344.92	\$1,779,636.58	
NC	\$11,018.02	\$164,804.24	\$315,139.92	\$448,638.72	\$939,600.90	
NY	\$24,207.43	\$165,046.23	\$256,294.27	\$430,971.24	\$876,519.17	
GA	\$40,305.80	\$152,807.51	\$239,451.05	\$417,037.28	\$849,601.64	

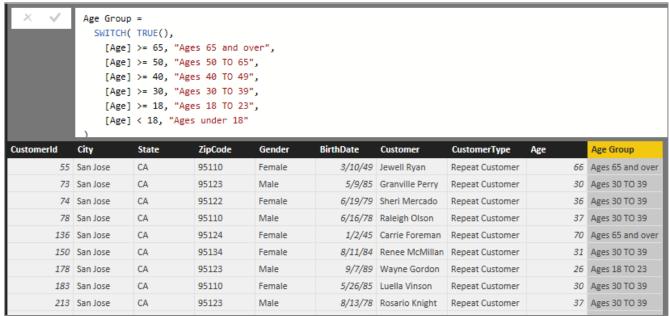

Calculated Column for Customer Age Group

1. Calculate customer age from birthdate

Ш	X								
	CustomerId	City	State	ZipCode	Gender	BirthDate	Customer	CustomerType	Age
	55	San Jose	CA	95110	Female	3/10/49	Jewell Ryan	Repeat Customer	66
_	73	San Jose	CA	95123	Male	5/9/85	Granville Perry	Repeat Customer	30
唱	74	San Jose	CA	95122	Female	6/19/79	Sheri Mercado	Repeat Customer	36
	78	San Jose	CA	95110	Male	6/16/78	Raleigh Olson	Repeat Customer	37
	136	San Jose	CA	95124	Female	1/2/45	Carrie Foreman	Repeat Customer	70
	150	San Jose	CA	95134	Female	8/11/84	Renee McMillan	Repeat Customer	31

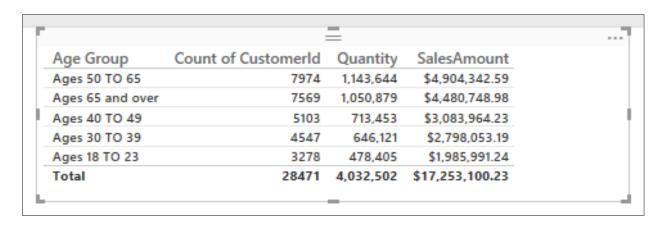

2. Calculate age groups using calculated column

Calculated Column as a Row Label

Age Group can now be used as row label

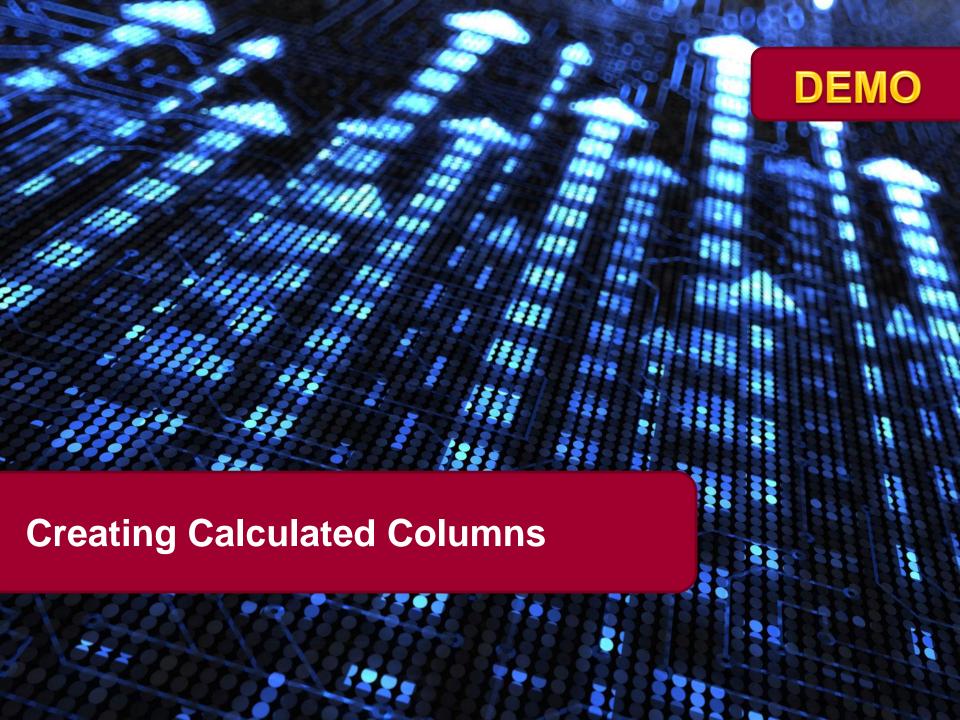

Calculated Column used in a Slicer

Calculated column can populate slicer values

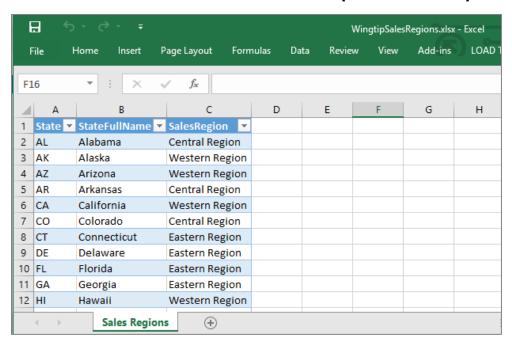

Adding Lookup Tables to the Data Model

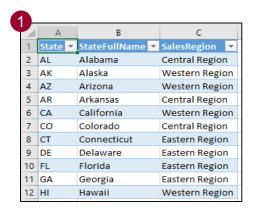

- Data modeling might required adding lookup tables
 - Lookup tables inject extra related data into data model
- Example: Sales Regions table
 - Assign each state to specific sales region
 - Include full state name it required in reporting

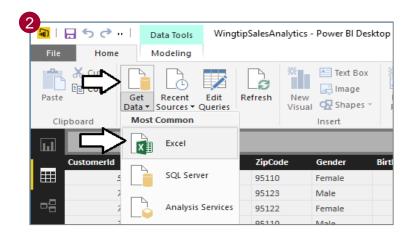

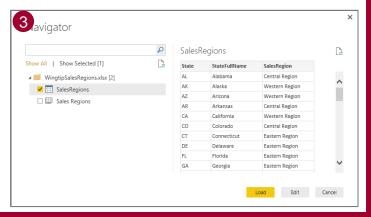

Importing the SalesRegions Table from Excel

Import table from Excel using Power Query

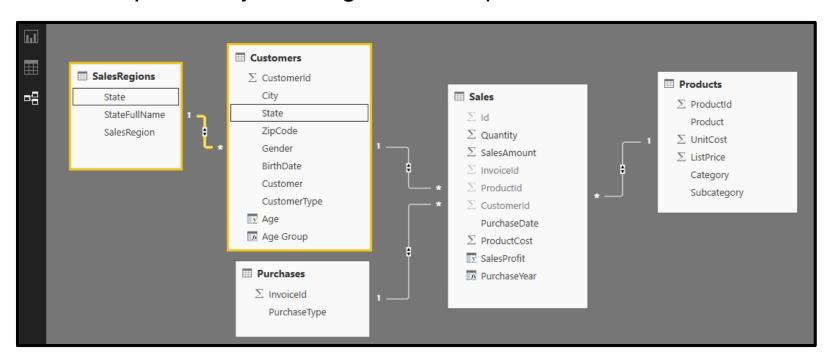

Integrating the Lookup Table into the Data Model

- Lookup table must be integrated into data model
 - Accomplished by creating relationship to one or more tables

The RELATED Function

- RELATED function performs cross-table lookup
 - Effectively replaces older VLOOKUP function
 - Used in many-side table to look up value from one-side
 - Used to pull data from lookup table into primary table

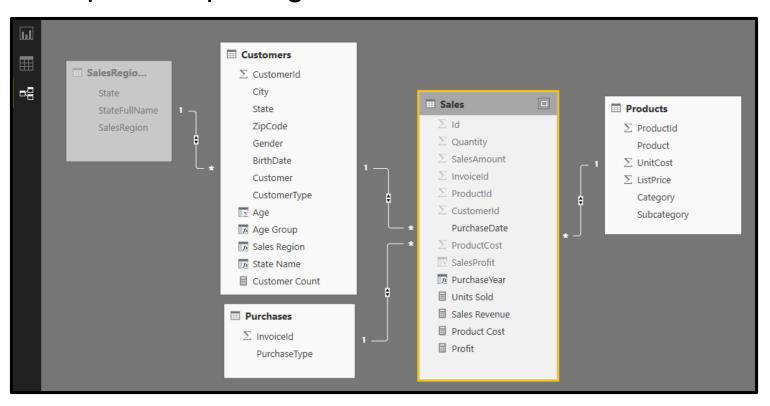

Ш	× ✓	Sales Re	gion = REL	ATED(SalesReg	gions[SalesF	tegion])					
	CustomerId	City	State	ZipCode	Gender	BirthDate	Customer	CustomerType	Age	Age Group	Sales Region
	55	San Jose	CA	95110	Female	3/10/49	Jewell Ryan	Repeat Customer	66	Ages 65 and over	Western Region
	73	San Jose	CA	95123	Male	5/9/85	Granville Perry	Repeat Customer	30	Ages 30 TO 39	Western Region
唱	74	San Jose	CA	95122	Female	6/19/79	Sheri Mercado	Repeat Customer	36	Ages 30 TO 39	Western Region
	78	San Jose	CA	95110	Male	6/16/78	Raleigh Olson	Repeat Customer	37	Ages 30 TO 39	Western Region
	136	San Jose	CA	95124	Female	1/2/45	Carrie Foreman	Repeat Customer	70	Ages 65 and over	Western Region
	150	San Jose	CA	95134	Female	8/11/84	Renee McMillan	Repeat Customer	31	Ages 30 TO 39	Western Region

ш	× ✓	State Nam	State Name = RELATED(SalesRegions[StateFullName])									
	State	ZipCode	Gender	BirthDate	Customer	CustomerType	Age	Age Group	Sales Region	State Name		
	CA	95110	Female	3/10/49	Jewell Ryan	Repeat Customer	66	Ages 65 and over	Western Region	California		
	CA	95123	Male	5/9/85	Granville Perry	Repeat Customer	30	Ages 30 TO 39	Western Region	California		
唱	CA	95122	Female	6/19/79	Sheri Mercado	Repeat Customer	36	Ages 30 TO 39	Western Region	California		
	CA	95110	Male	6/16/78	Raleigh Olson	Repeat Customer	37	Ages 30 TO 39	Western Region	California		
	CA	95124	Female	1/2/45	Carrie Foreman	Repeat Customer	70	Ages 65 and over	Western Region	California		
	CA	95134	Female	8/11/84	Renee McMillan	Repeat Customer	31	Ages 30 TO 39	Western Region	California		

Hiding the Lookup Table

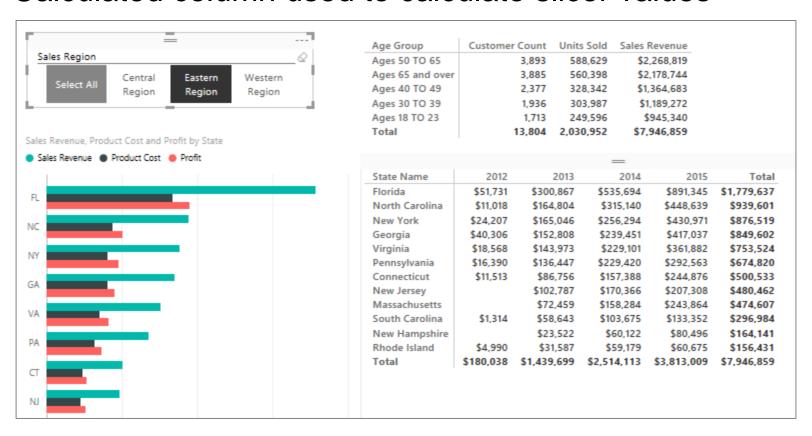

- Lookup table can often be hidden
 - simplifies reporting for data model consumers

Filtering on Sales Region

Calculated column used to calculate slicer values

Agenda

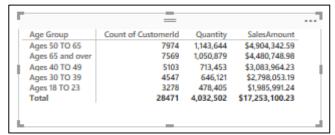

- Designing a Data model
- Creating Calculated Columns
- Creating Measures
- Adding Geographic Fields to a Data Model
- Creating Dimensional Hierarchies
- Understanding the Evaluation Context

Benefits of Measures over Calculated Columns

- Calculated columns can be aggregated in visual
 - However, aggregation details are stored in visual
 - Visual doesn't offer control over name and formatting

- Measure defines name, aggregation and formatting
 - Work is done once and reused across many visuals
 - Makes data model more fool-proof for report designers

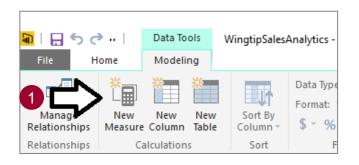

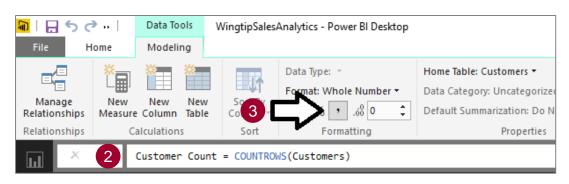

Age Group	Customer Count	Units Sold	Sales Revenue	
Ages 50 TO 65	7,974	1,143,644	\$4,904,343	
Ages 65 and over	7,569	1,050,879	\$4,480,749	
Ages 40 TO 49	5,103	713,453	\$3,083,964	
Ages 30 TO 39	4,547	646,121	\$2,798,053	
Ages 18 TO 23	3,278	478,405	\$1,985,991	
Total	28,471	4,032,502	\$17,253,100	

Creating Measures

- Measures have advantage over calculated columns
 - They are evaluated based on the current evaluation context
- Creating a measure with Power BI Desktop
 - Click New Measure button
 - 2. Give measure a name and write DAX expressions
 - 3. Configure formatting

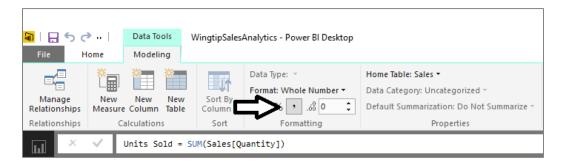

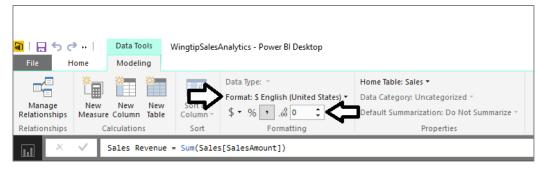

Formatting Measures

Format as whole number

Format as currency

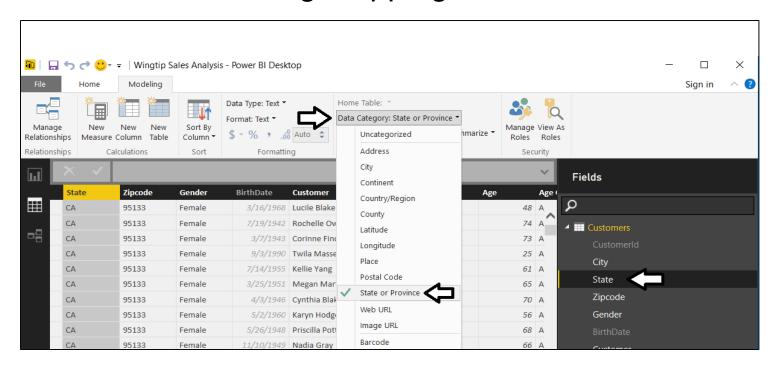

Agenda

- Designing a Data model
- Creating Calculated Columns
- ✓ Creating Measures
- Adding Geographic Fields to a Data Model
- Creating Dimensional Hierarchies
- Understanding the Evaluation Context

Geographic Field Metadata

- Fields in data model have metadata properties
 - Metadata used by visuals and reporting tools
 - Used as hints to Bing Mapping service

Eliminate Geographic Ambiguity

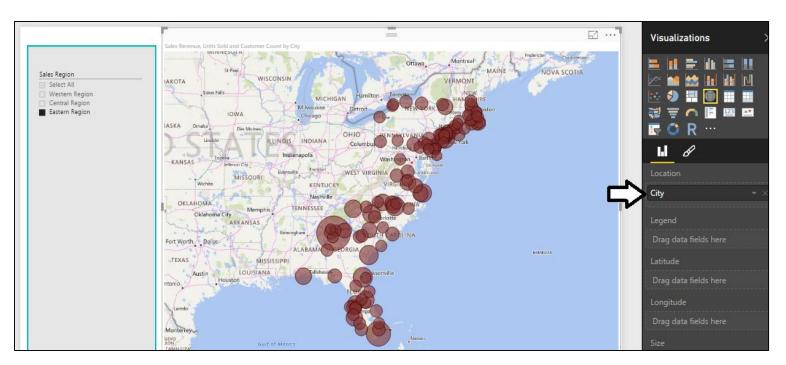

- City name alone is ambiguous
 - "Athens" defaults to Greece not Georgia
 - Concatenate city name with state to disambiguate

>	City = [City Name]	& ", " & [State]			
	Age Group	Sales Region	State Name	SalesRegionSort	City
48	Ages 40 TO 49	Western Region	California	1	San Jose, CA
74	Ages 65 and over	Western Region	California	1	San Jose, CA
73	Ages 65 and over	Western Region	California	1	San Jose, CA
25	Ages 18 TO 23	Western Region	California	1	San Jose, CA
61	Ages 50 TO 65	Western Region	California	1	San Jose, CA
65	Ages 65 and over	Western Region	California	1	San Jose, CA

Using Map Visual with a Geographic Field

- Map Visual shows distribution over geographic area
 - Visual automatically updates when filtered

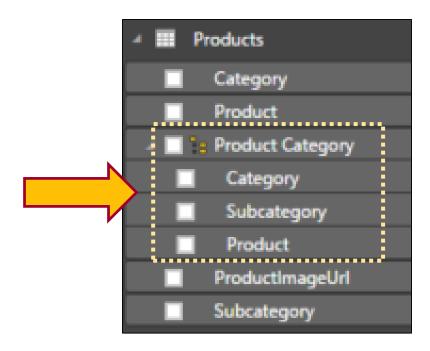

Agenda

- Designing a Data model
- Creating Calculated Columns
- ✓ Creating Measures
- Adding Geographic Fields to a Data Model
- Creating Dimensional Hierarchies
- Understanding the Evaluation Context

Dimensional Hierarchies

- Hierarchy created from two or more columns
 - All columns in hierarchy must be from the same table
 - Defines parent-child relationship between columns
 - Provides path to navigate through data
 - Provides path to drill down into greater level of detail

Pulling Columns for Hierarchy into Single Table

- Sometimes hierarchy columns are spread across tables
 - Use RELATED function from DAX to pull columns into single table

× ✓	Sales Region = RELATED(SalesRegions[SalesRegion])						
Customer		Customer Type	Age	Age Group	Sales Region	State Name	
Lucile Blake		One-time Customer	48	Ages 40 TO 49	Western Region	California	
Rochelle Owen		One-time Customer	74	Ages 65 and over	Western Region	California	
Corinne Finch		One-time Customer	73	Ages 65 and over	Western Region	California	
Twila Massey		One-time Customer	25	Ages 18 TO 23	Western Region	California	

Then create hierarchy in the table with all the columns

Agenda

- Designing a Data model
- Creating Calculated Columns
- ✓ Creating Measures
- Adding Geographic Fields to a Data Model
- Creating Dimensional Hierarchies
- Understanding the Evaluation Context

A Tale of Two Evaluation Contexts

Row Context

- Context includes all columns in iteration of current row
- Used to evaluate DAX expression in calculated column
- Only available in measures with iterator function (e.g. SUMX)

Filter Context

- Context includes filter(s) defining current set of rows
- Used by default to evaluate DAX expressions in measures
- Can be fully ignored or partially ignored using DAX code
- Not used to evaluate DAX in calculated columns

Understanding Row Context

Row context used to evaluate calculated columns

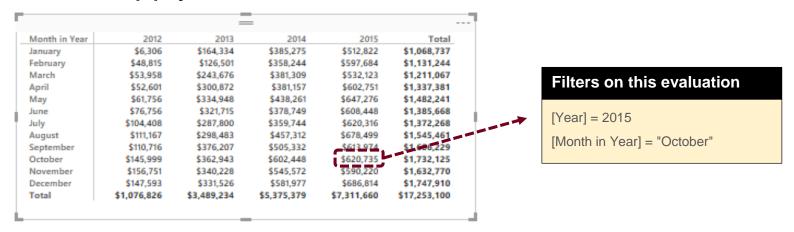

>	City = [City Name]	& ", " & [State]			
	Age Group	Sales Region	State Name	SalesRegionSort	City
48	Ages 40 TO 49	Western Region	California	1	San Jose, CA
74	Ages 65 and over	Western Region	California	1	San Jose, CA
73	Ages 65 and over	Western Region	California	1	San Jose, CA
25	Ages 18 TO 23	Western Region	California	1	San Jose, CA
61	Ages 50 TO 65	Western Region	California	1	San Jose, CA
65	Ages 65 and over	Western Region	California	1	San Jose, CA

× ✓	Age = Floor((TODAY()-Customers[BirthDate])/365, 1)					
Customer		Customer Type	Age	Age Group	Sales Region	State Name
Lucile Blake		One-time Customer	48	Ages 40 TO 49	Western Region	California
Rochelle Owen		One-time Customer	74	Ages 65 and over	Western Region	California
Corinne Finch		One-time Customer	73	Ages 65 and over	Western Region	California

Understanding Filter Context

Visuals apply various filters in different evaluation contexts

Filter context also affected by slicers and other filters

Filters on this evaluation [Year] = 2015 [Month in Year] = "October" [Sales Region] = "Western Region" [Customer Type] = "Repeat Customer"

Using the CALCULATE Function

- CALCULATE function provides greatest amount of control
 - First argument defines expression to evaluate
 - Second argument defines table on which to evaluate expression
 - You can evaluate expressions with or without current filter context

```
Pct of All Products =
DIVIDE(
    SUM( Sales[SalesAmount] ),
    CALCULATE(
        Sum (Sales[SalesAmount] ),
        ALL(Products[Category], Products[Subcategory], Products[Product])
    )
)
```

```
Pct of Product Category =
DIVIDE(
    SUM( Sales[SalesAmount] ),
    CALCULATE(
        Sum (Sales[SalesAmount] ),
        ALL( Products[Subcategory], Products[Product] )
    )
)
```

Summary

- Designing a Data model
- Creating Calculated Columns
- ✓ Creating Measures
- Adding Geographic Fields to a Data Model
- Understanding the Evaluation Context
